

Overview:

Dual Band Communications Hubs (DBCH) support two frequencies for the Home Area Network (HAN): **2.4GHz** and **868MHz**. When commissioning a GSME (gas meter) to a DBCH, engineers will be prompted to select the desired frequency during the pairing process.

Engineer Guidance:

-

Use **2.4GHz** (Single Band)

Select this frequency when:

- The GSME is **within 7 meters** of the communications hub.
- There are **no known obstructions**, such as thick walls or complex building layouts.

-

Use **868MHz** (Dual Band)

Select this frequency when:

- The GSME is **more than 7 meters** from the hub.
- There are **potential obstructions** (e.g., walls, staircases, or structural materials) that may impact signal strength.

Additional Notes:

1. Always assess the installation environment before selecting the frequency. Choosing the appropriate band ensures reliable HAN performance and reduces the risk of commissioning failure.
